

The Architecture of MHCDScript v2

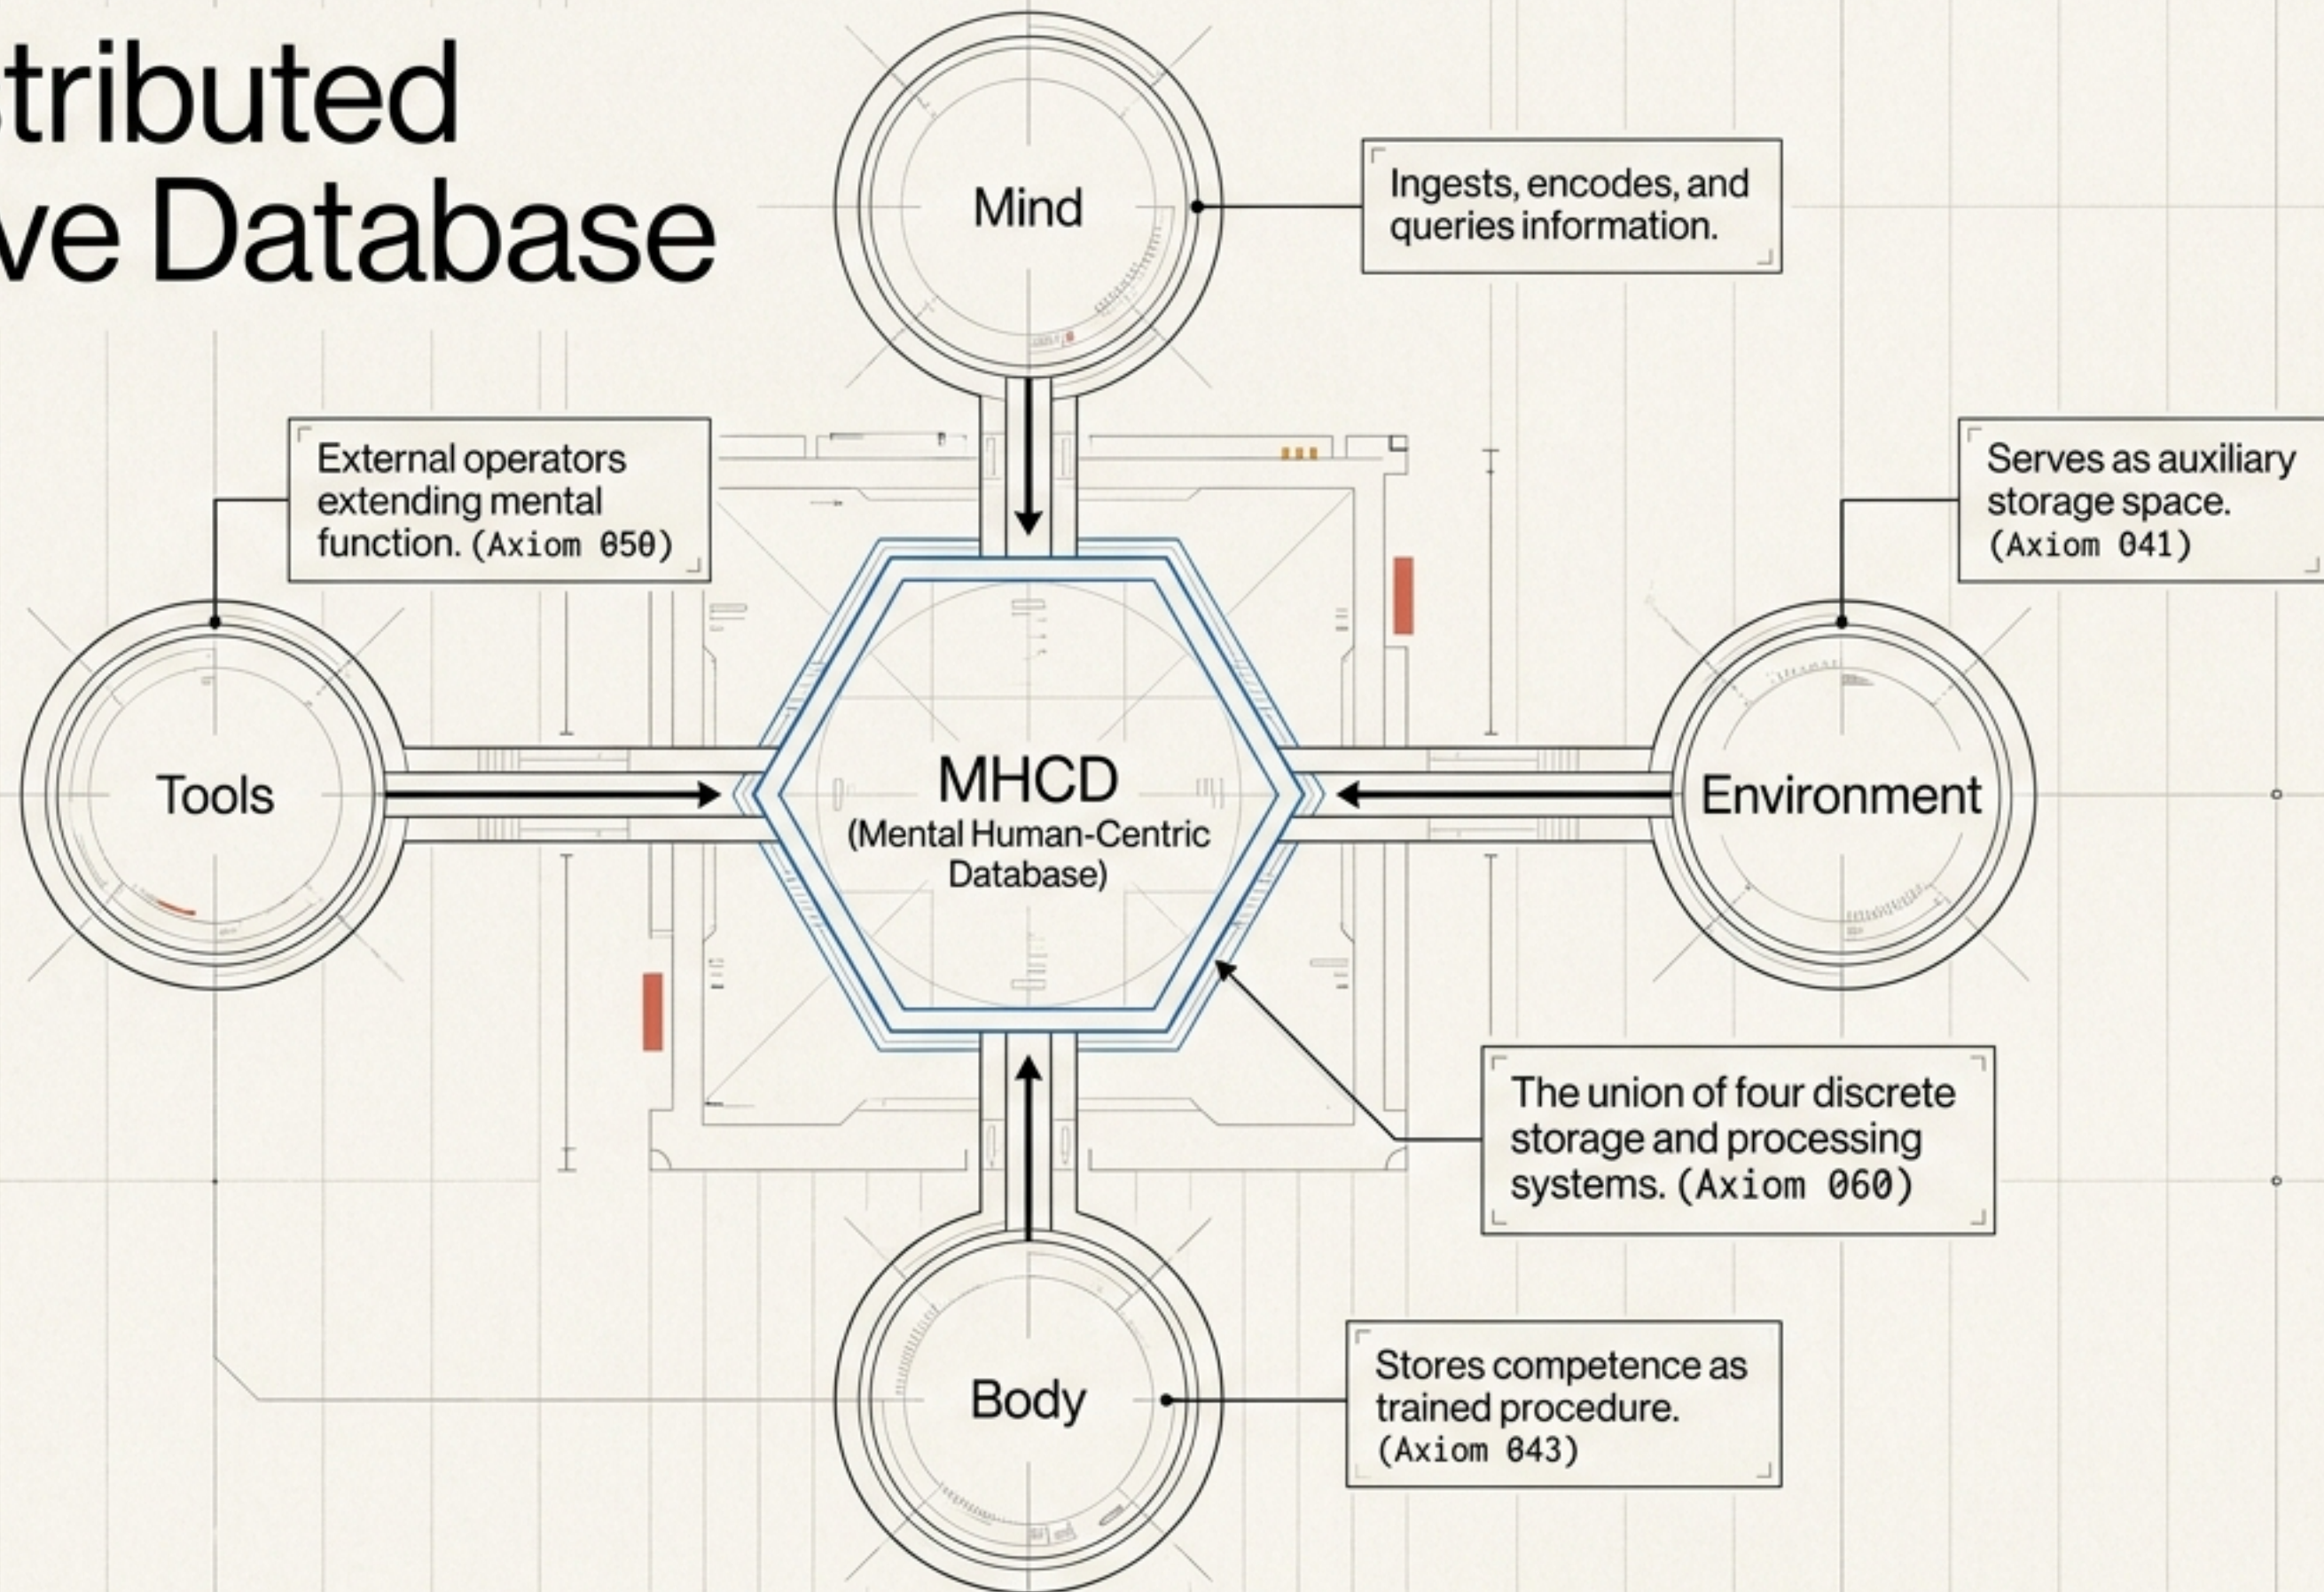

A programmable self-correction language for the mental human-centric database.

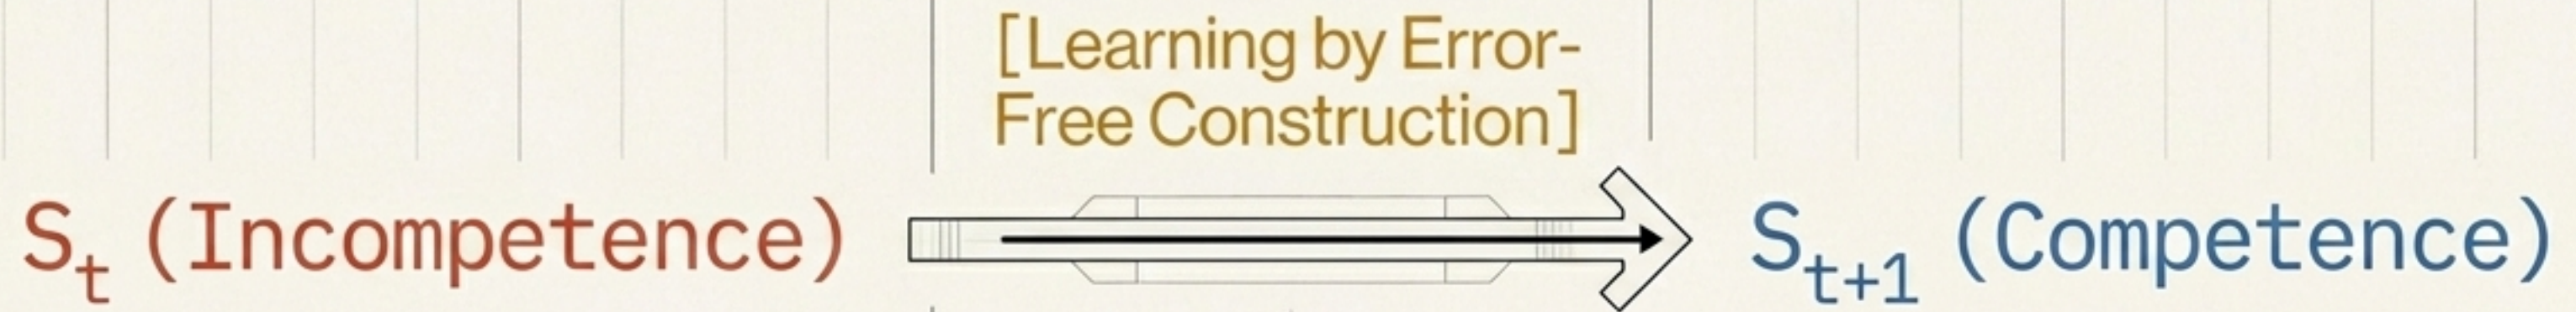

System Specification

Dominic Alexander Cooper

The Distributed Cognitive Database

The Core Semantic Law of the Runtime

System.Goal: Reduce pain by increasing competence (Axiom 061)
System.Rule: Learn by error-free construction (Axiom 062)
System.Target: Complete competence under {014 + 015}

The Standard Library: Foundational Axioms

System Signals

EXISTENCE = True

PAIN = ValidSignal

INCOMPETENCE = NegativeState

Pain is a valid signal
indicating incompetence.

Engine Operations

LEARNING = ValidUpdate

CONSTRUCTION = PreferredEngine

CONTRADICTION = CorruptionSignal

Proof by error-free
construction is learning.

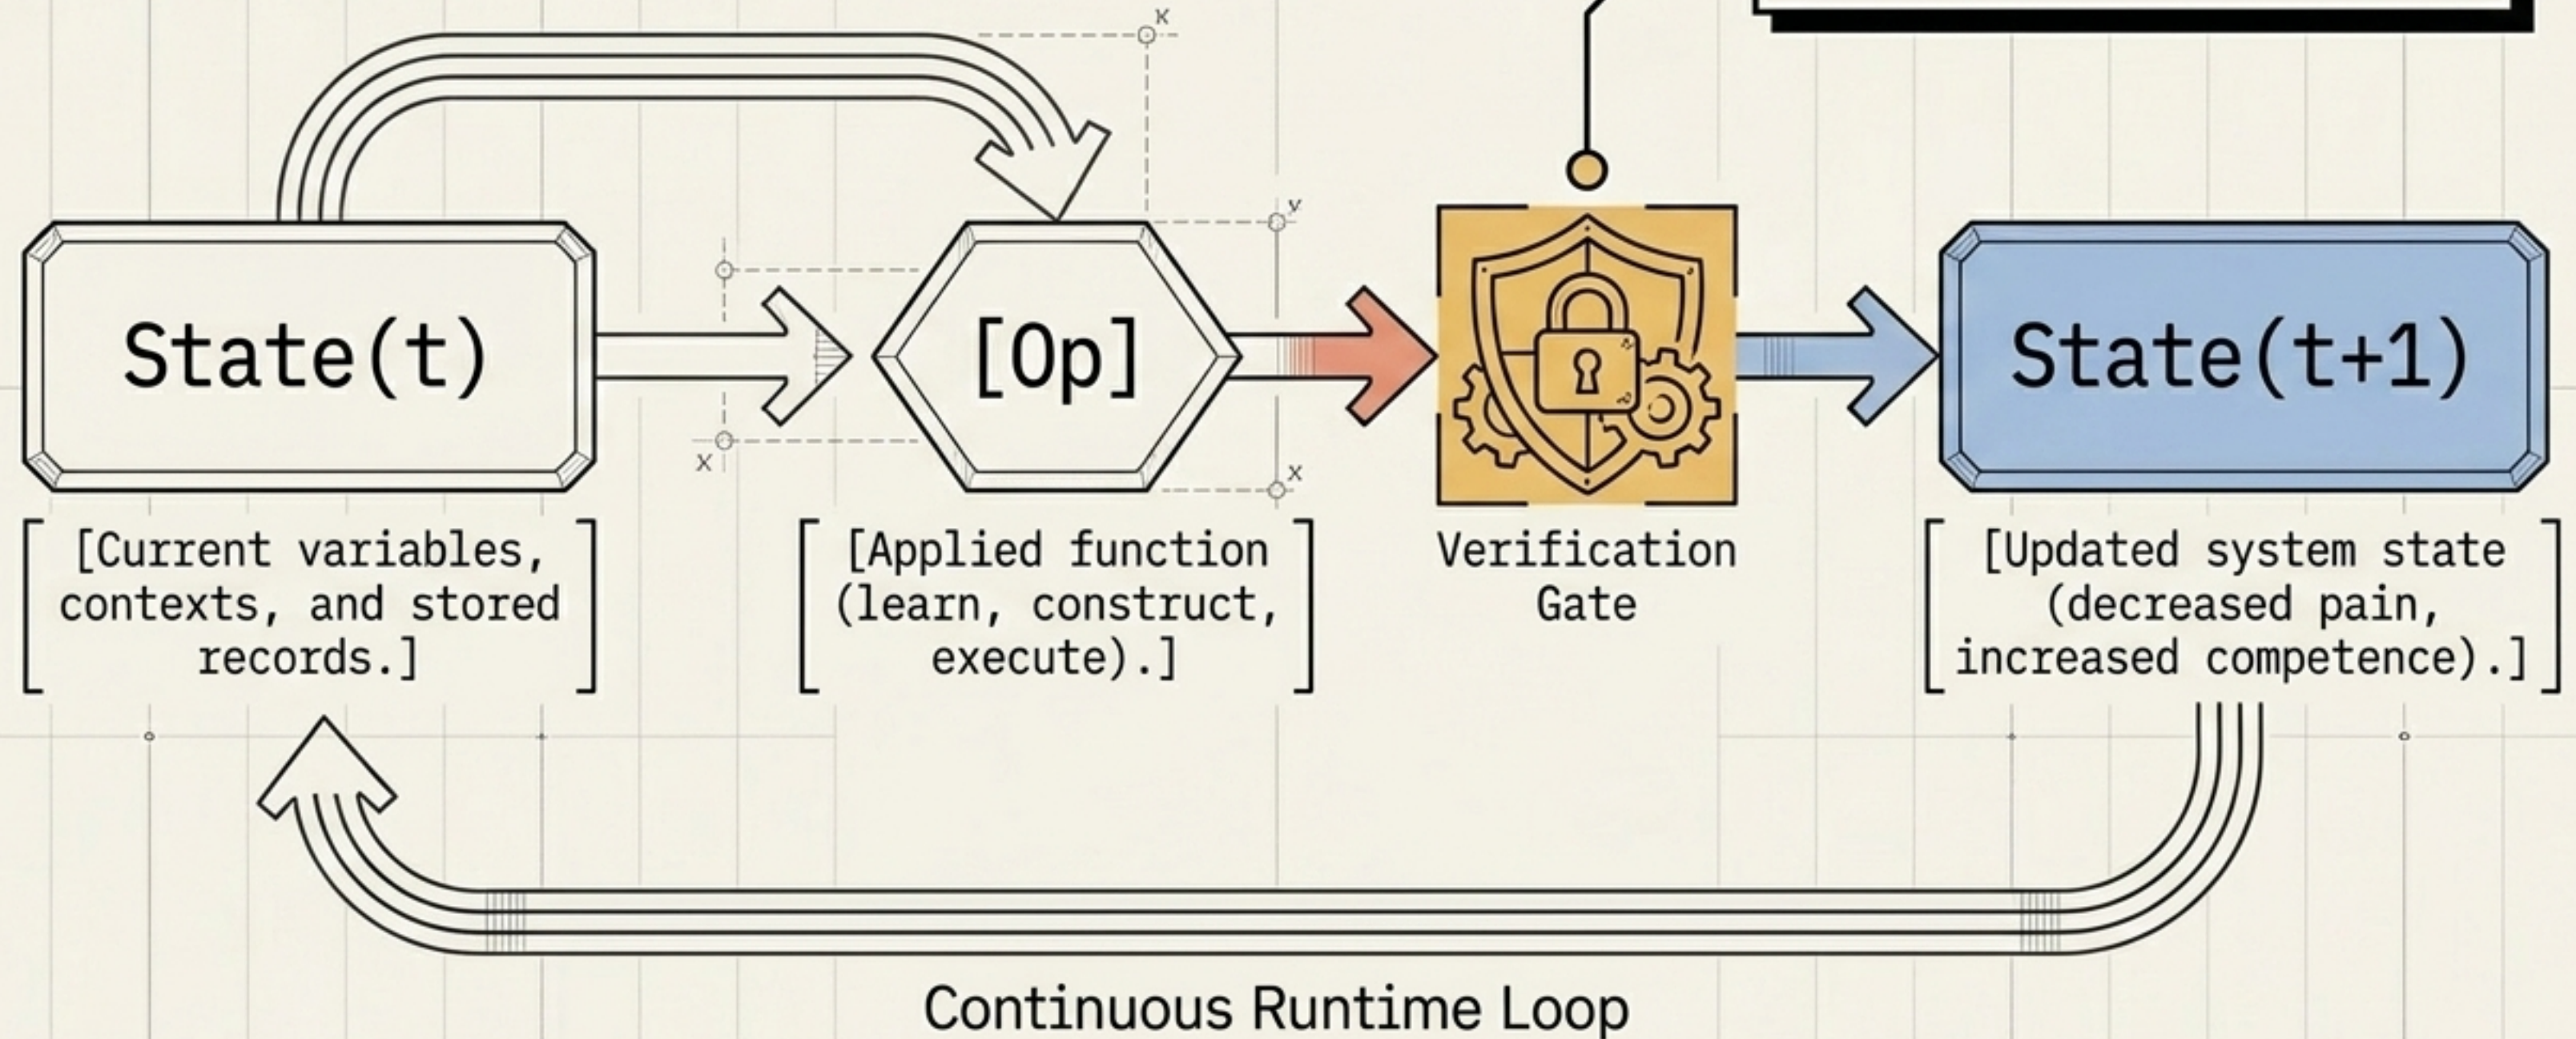

Base Ethics

INNOCENCE = Universal

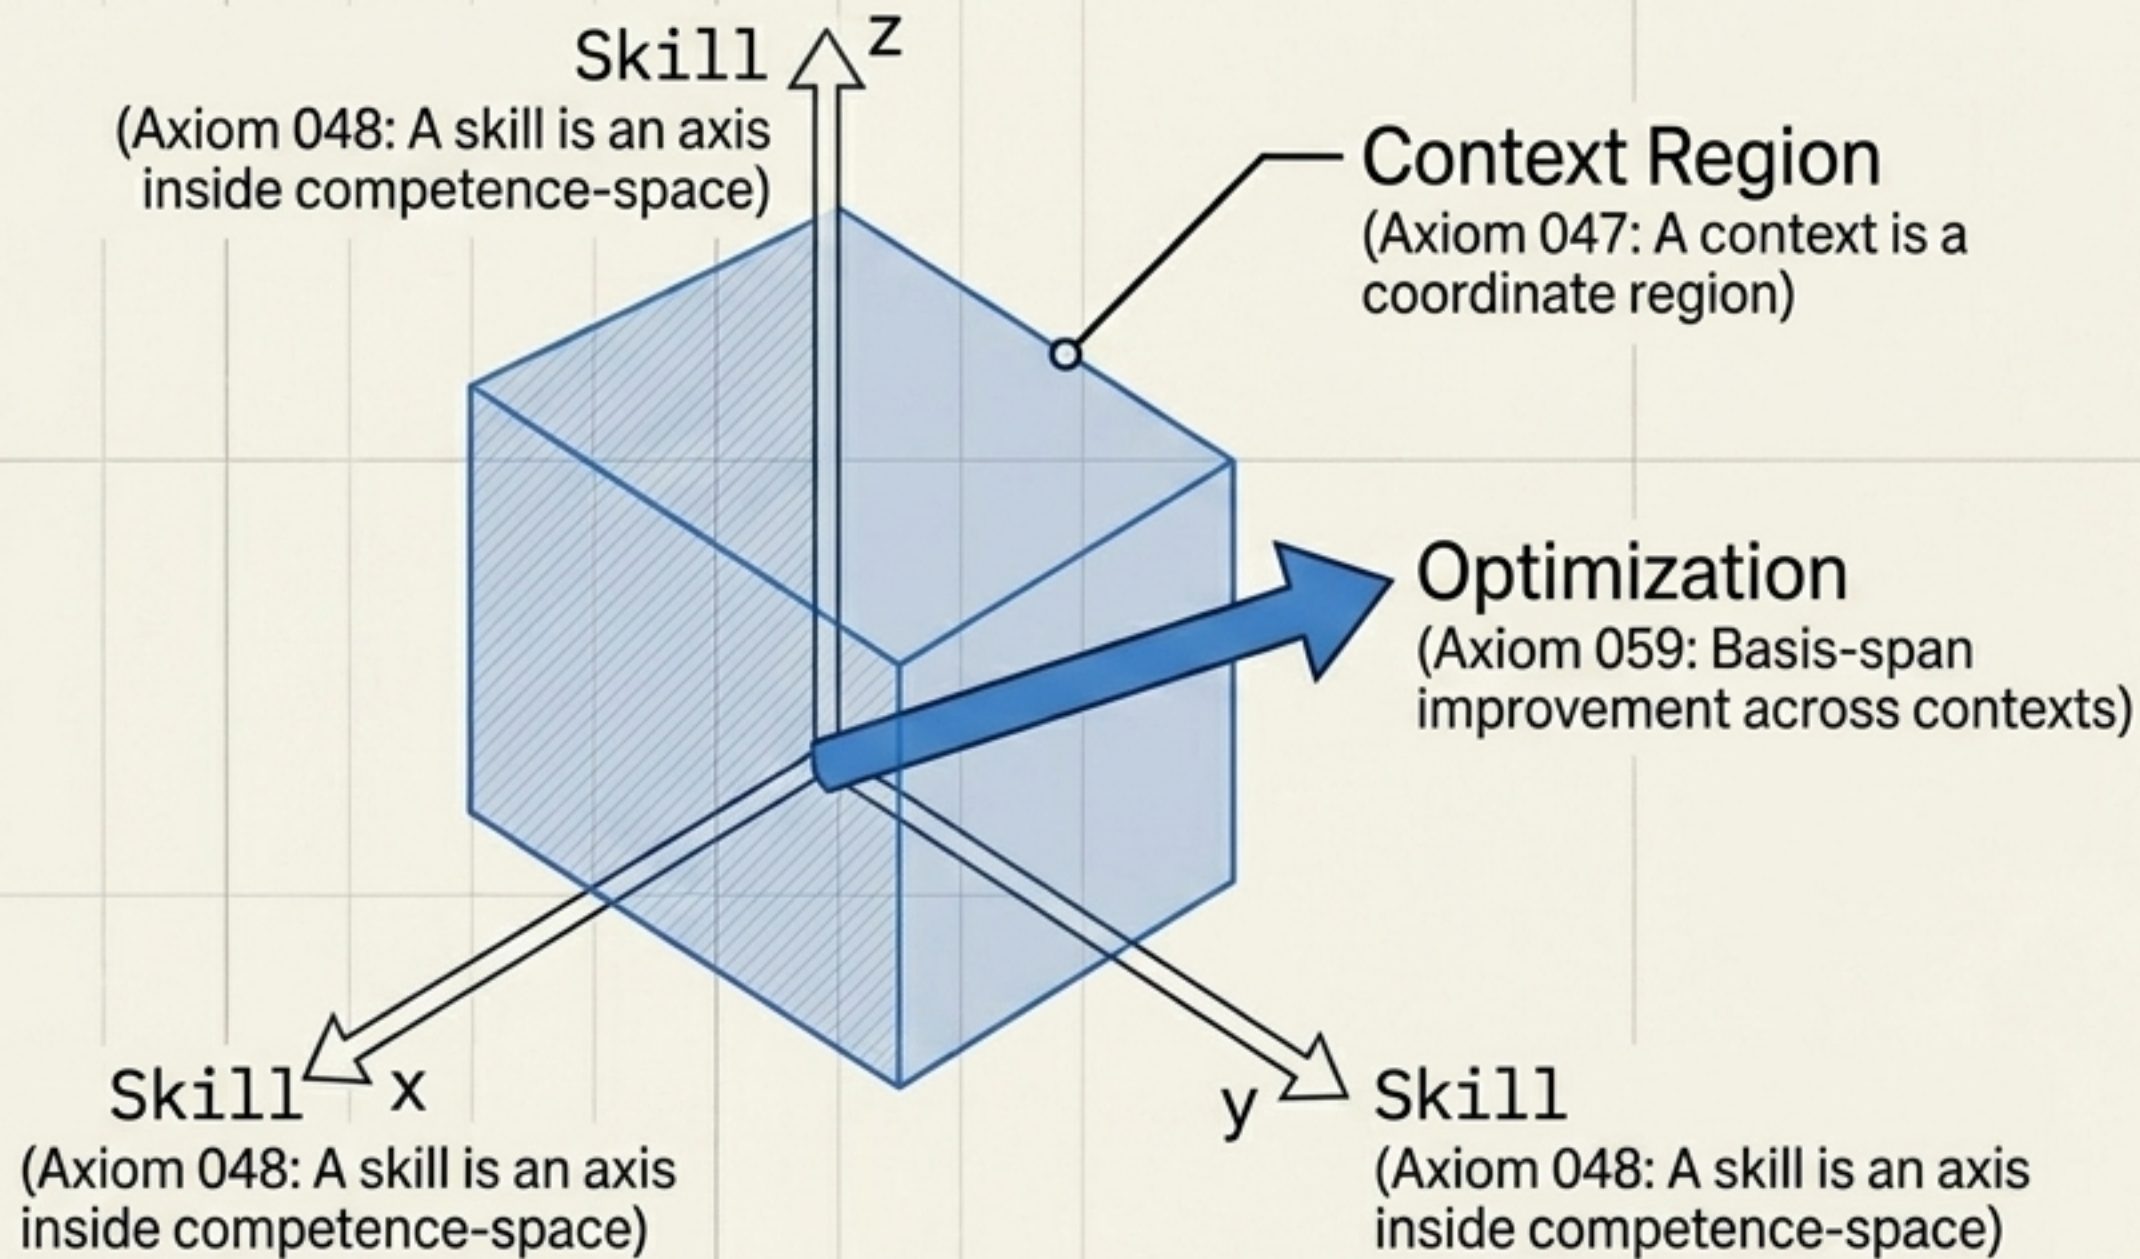

CORRECTION != Guilt

Handling errors through
competence-restoring
updates rather than blame.

Cognition as a Verified State Machine

The Topology of Competence-Space

Incompetence lacks
a functional axial
n-dimensional space
(Axioms 016 & 032).

It is structurally
unstable and
unmappable.

Universal Records: The Mental Data Model

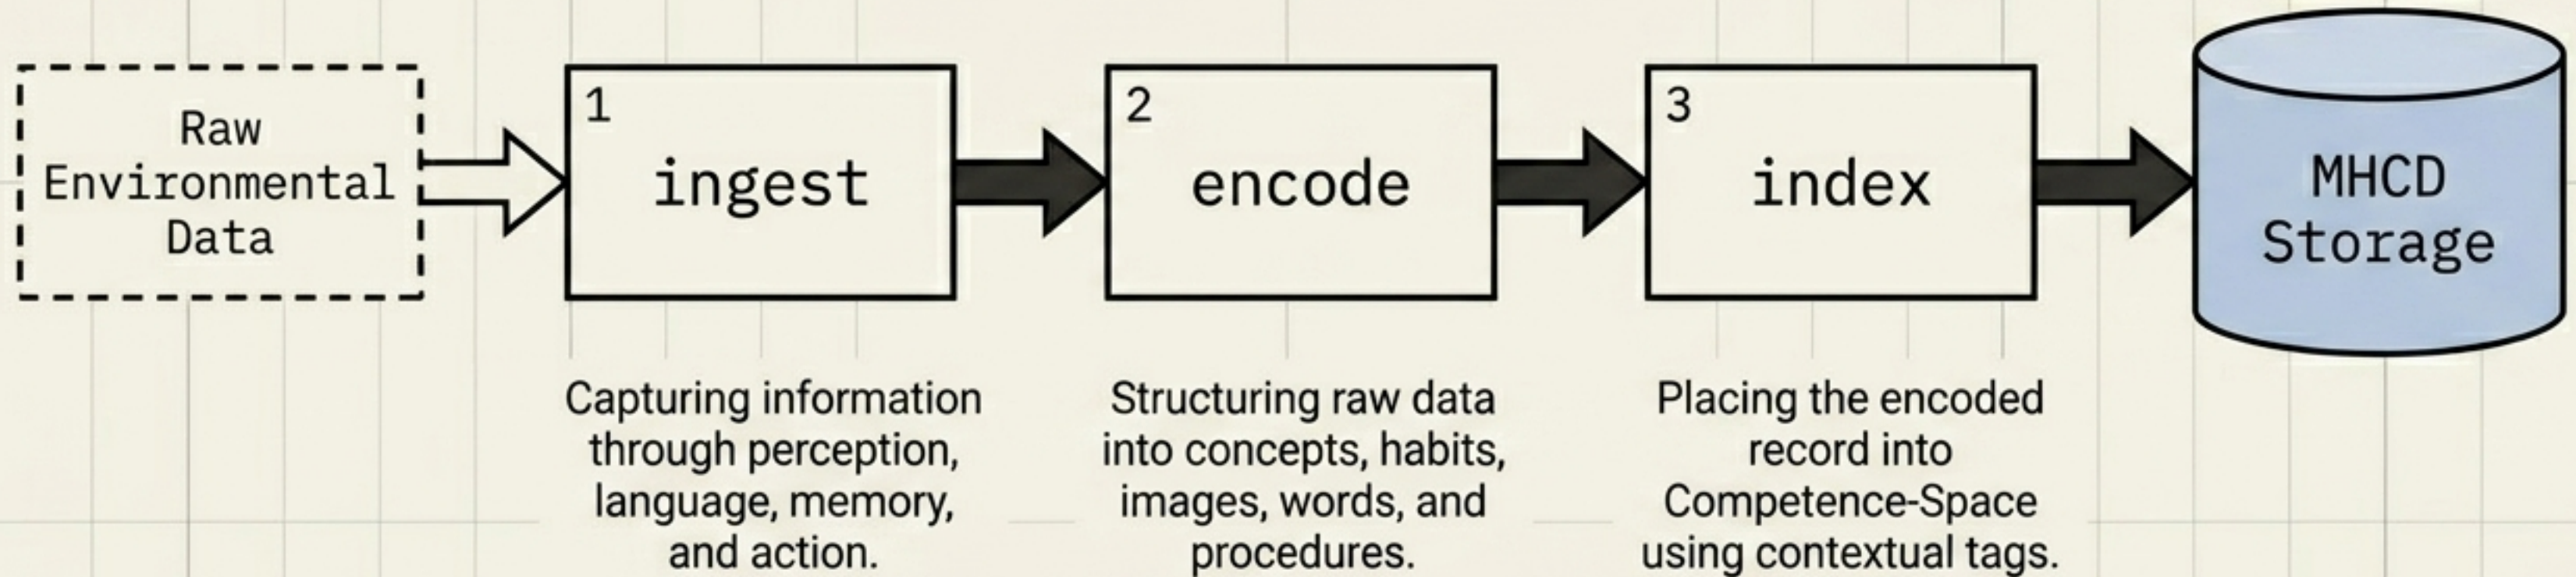

```
Record_ID: 0x8F9A
Type: Habit # (A repeated function over time)
Context_Index: ['work', 'focus']
Data: { procedure: 'deep_work_sequence' }
Validation: Status.ErrorFree
Metadata: {
  basis_span: optimized,
  timestamp: T+1
}
```

The standard data structure of the MHCD.

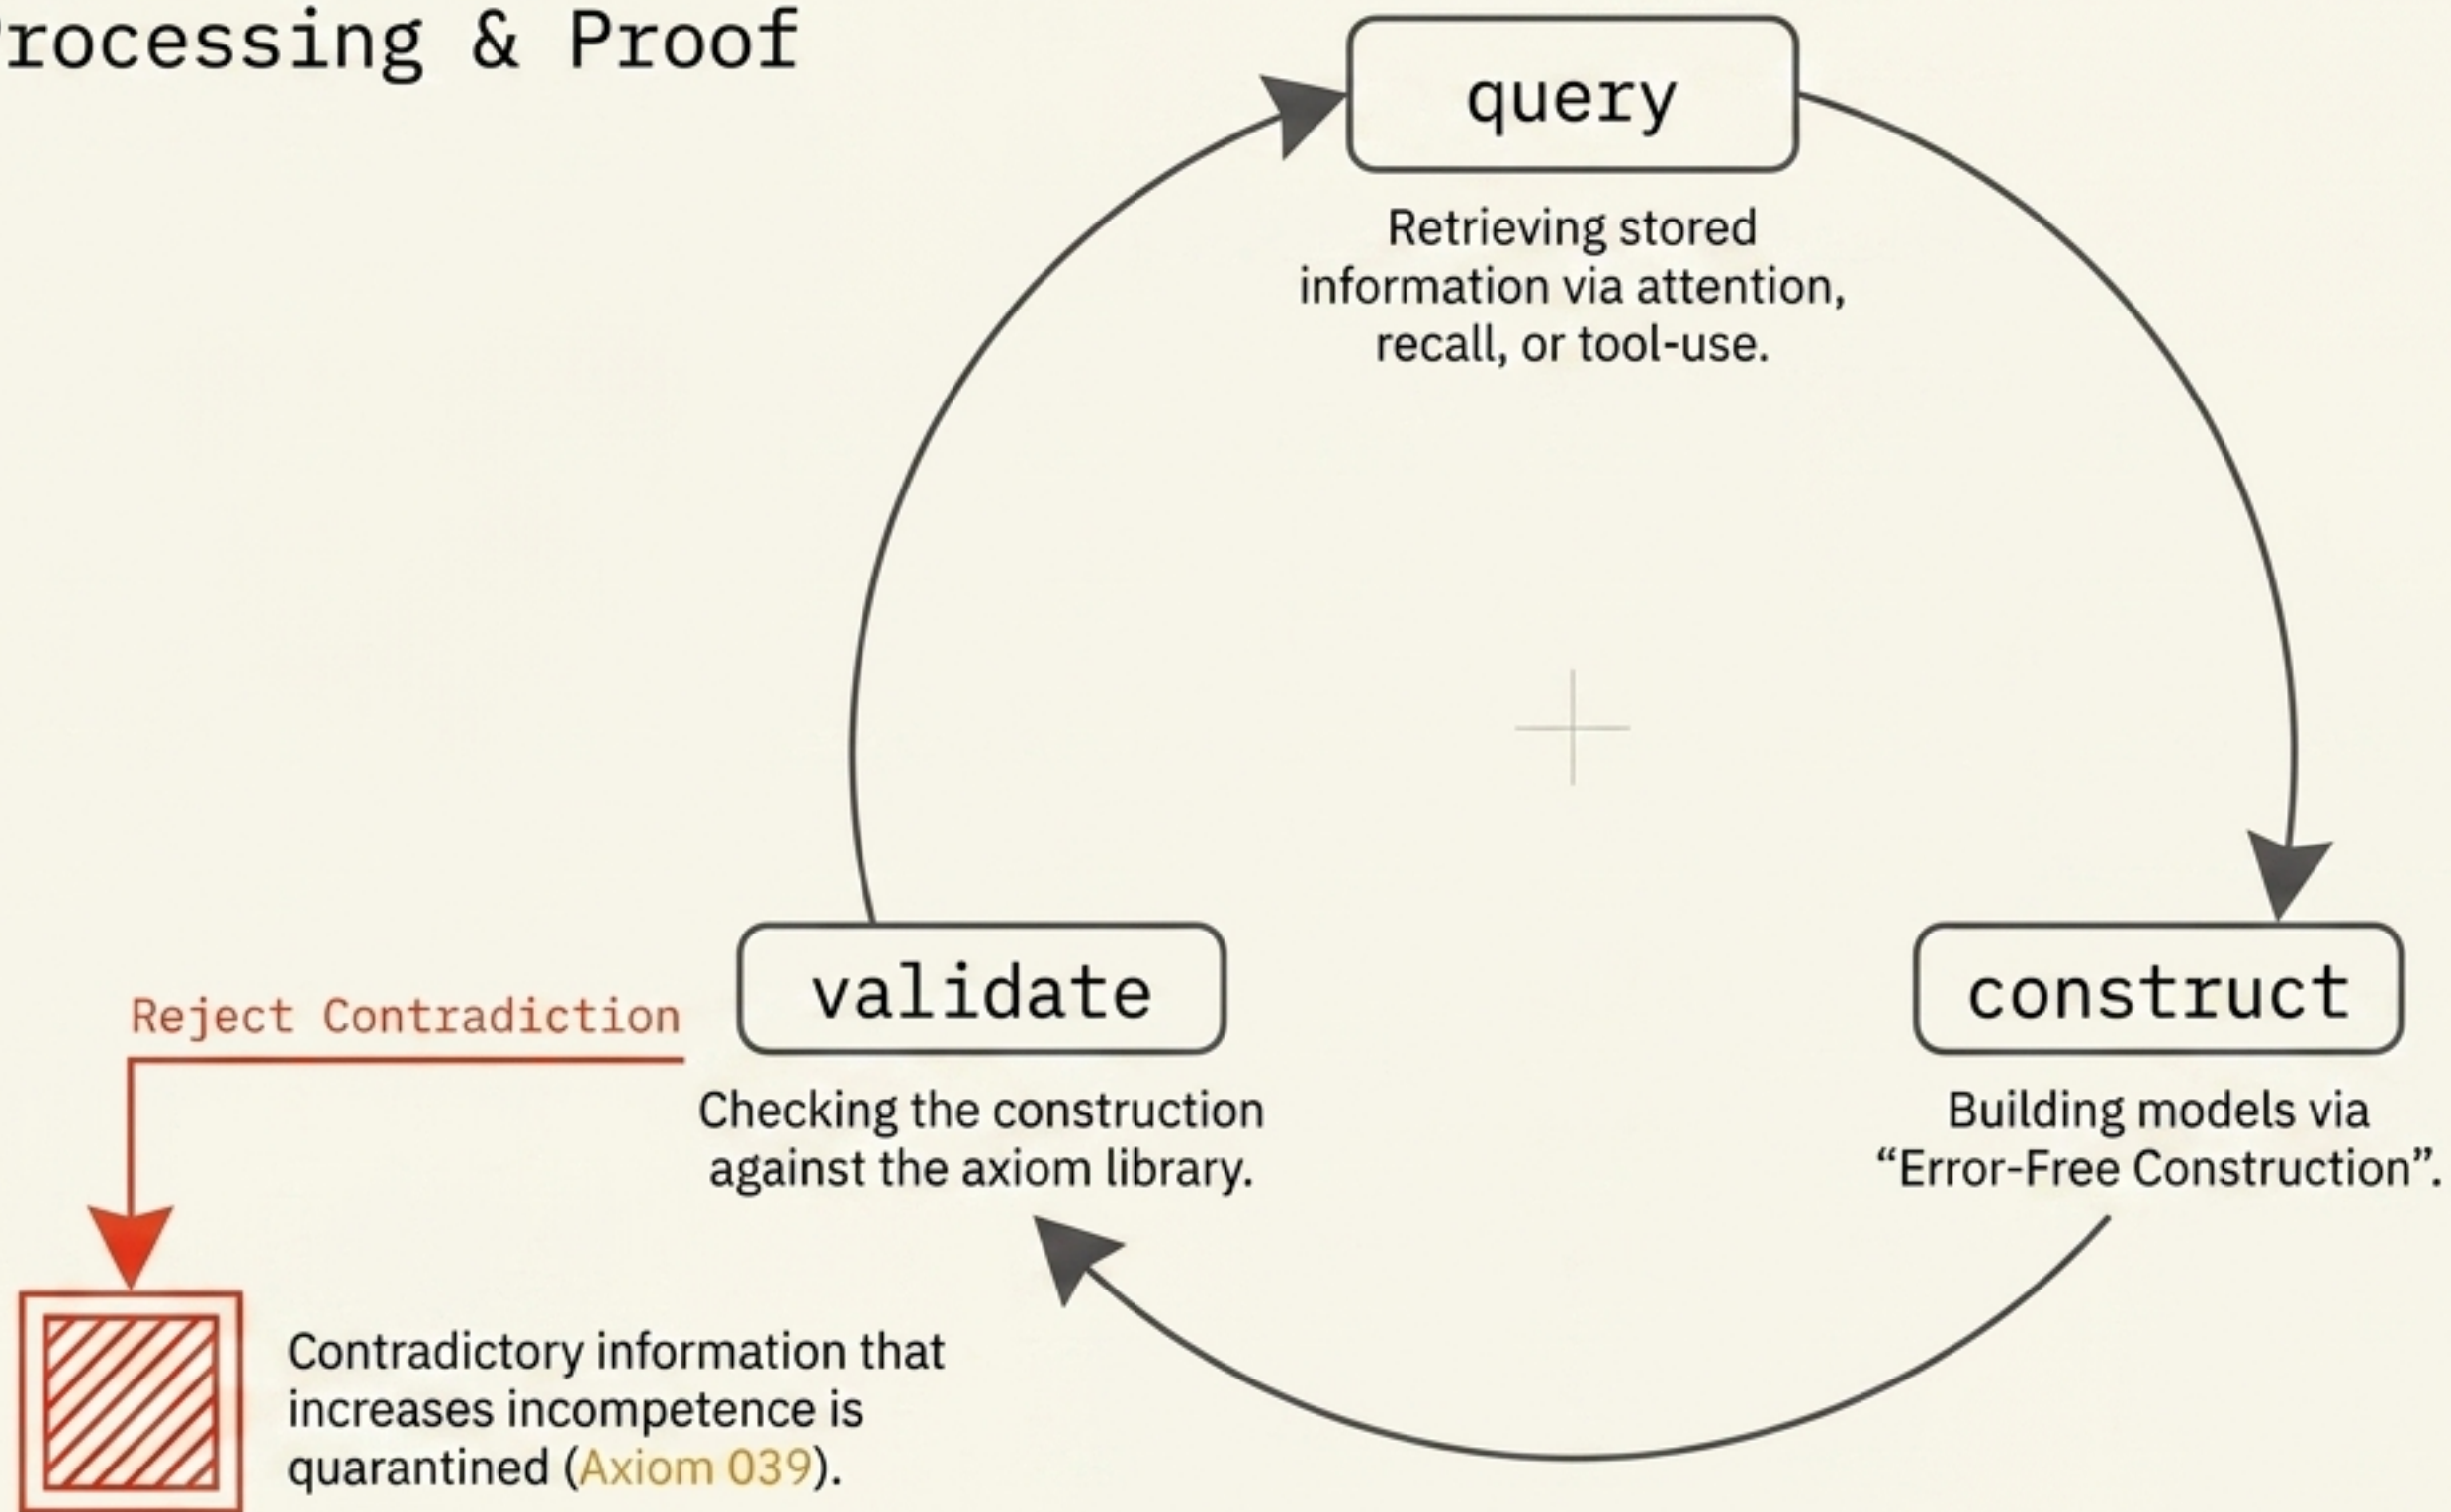

- Universally typed concepts, habits, and tools.
- The mind indexes information by association, label, context, emotion, and purpose (Axiom 035).
- Continuously updated and validated via runtime checks.

Operation Pipeline

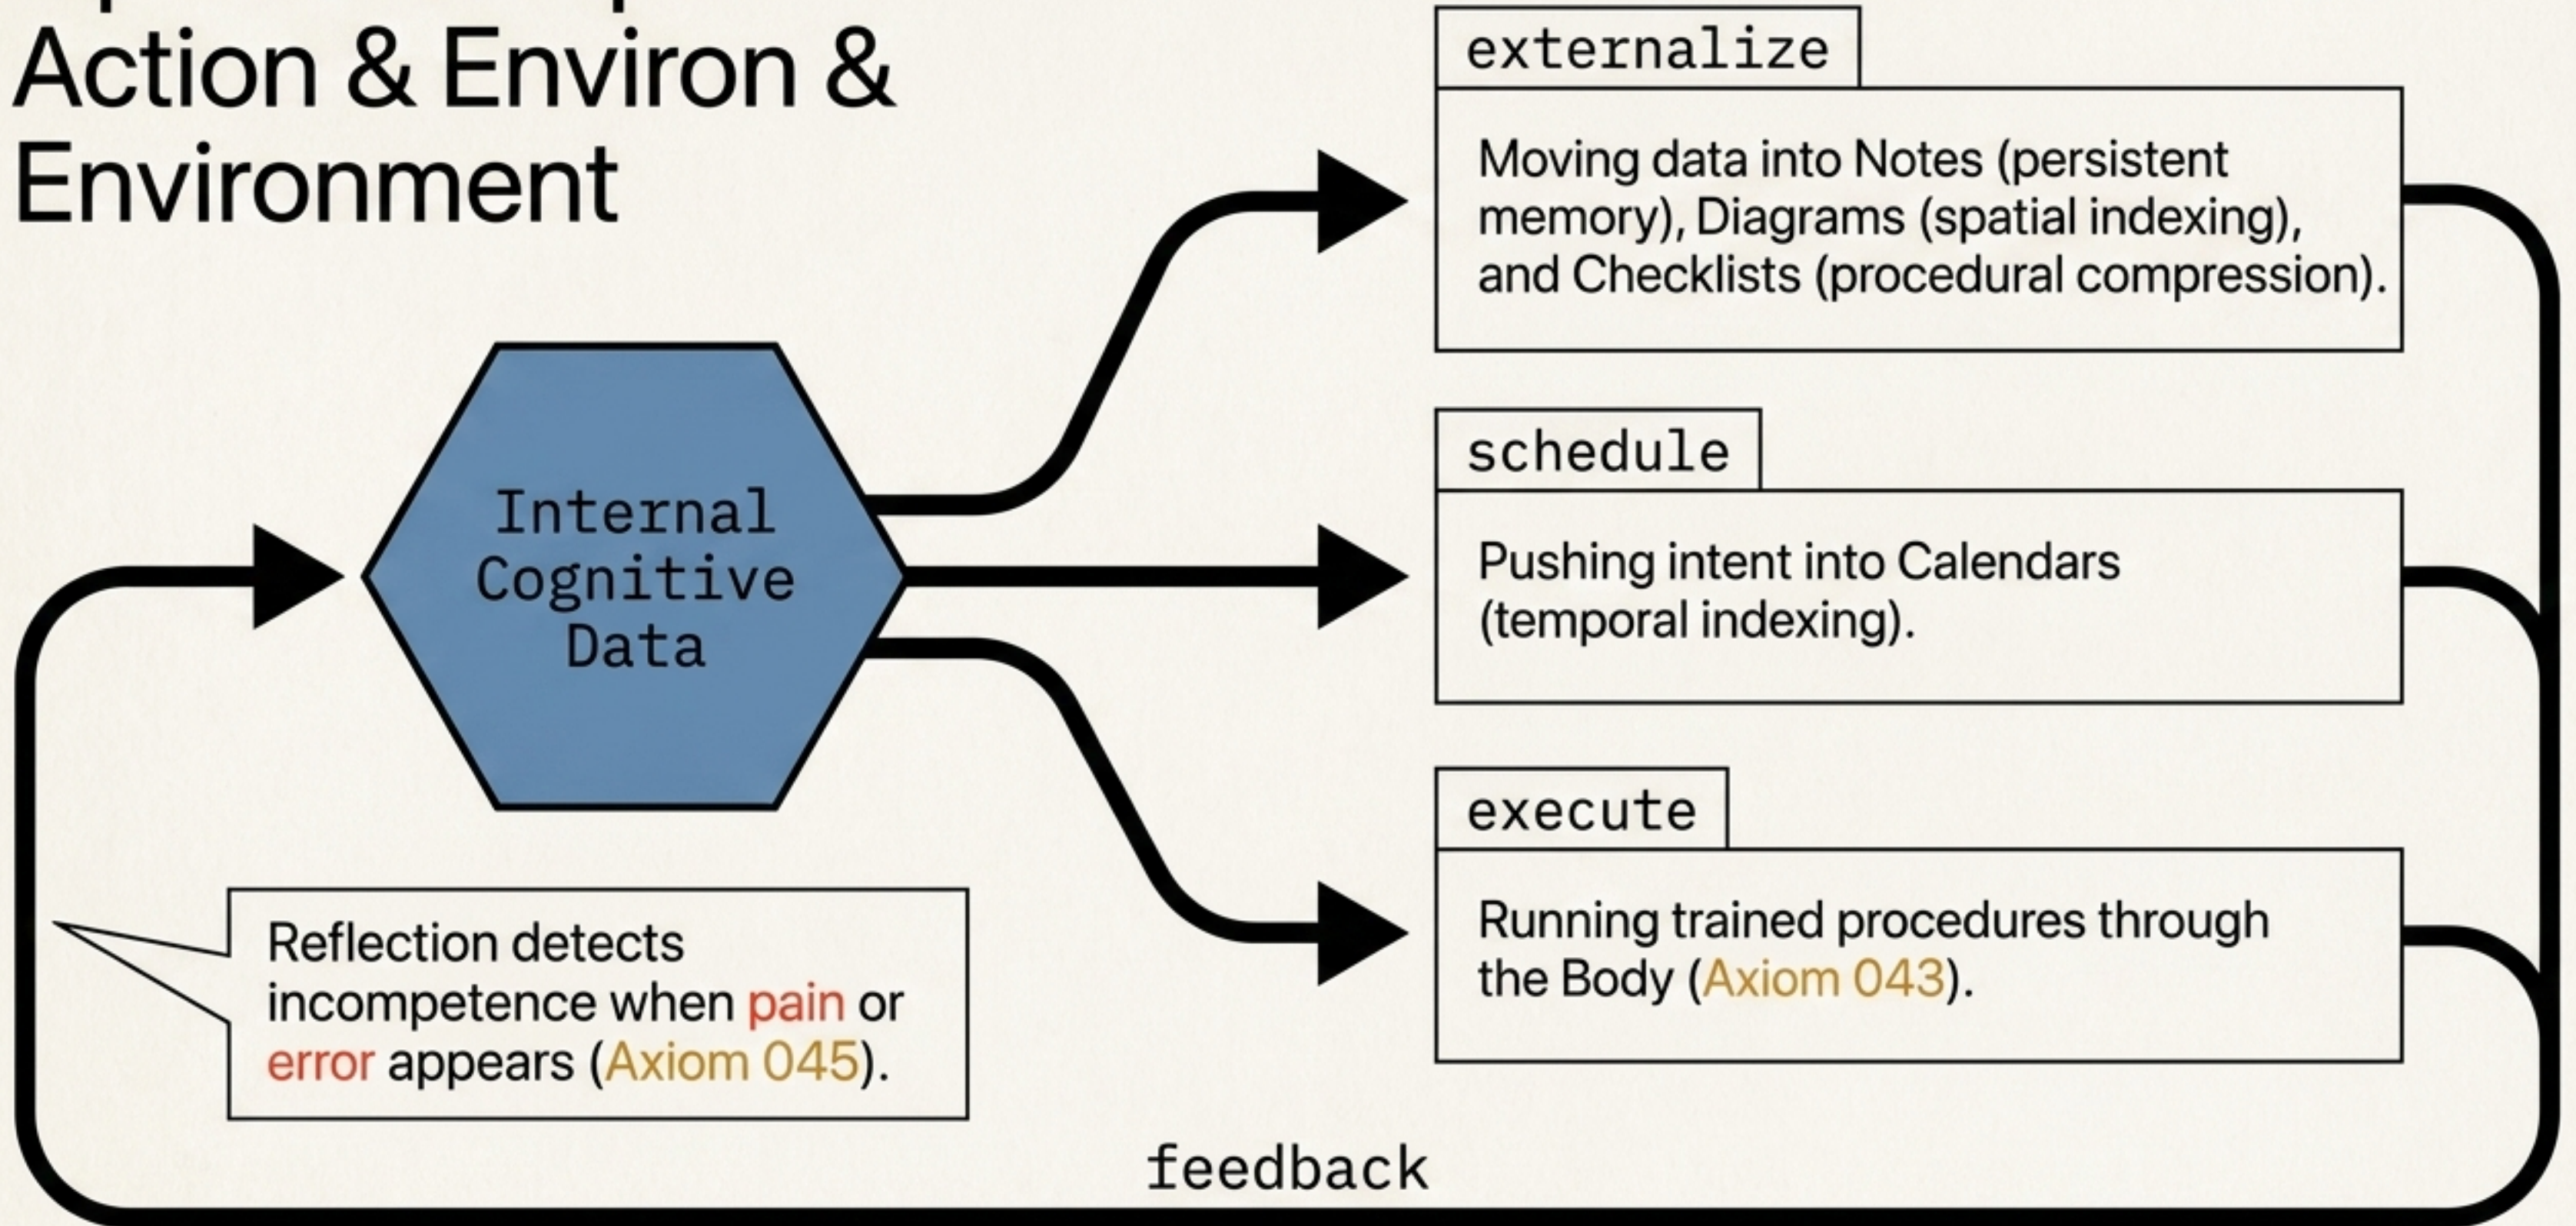

Phase I: Intake & Storage

Operation Pipeline Phase II: Processing & Proof

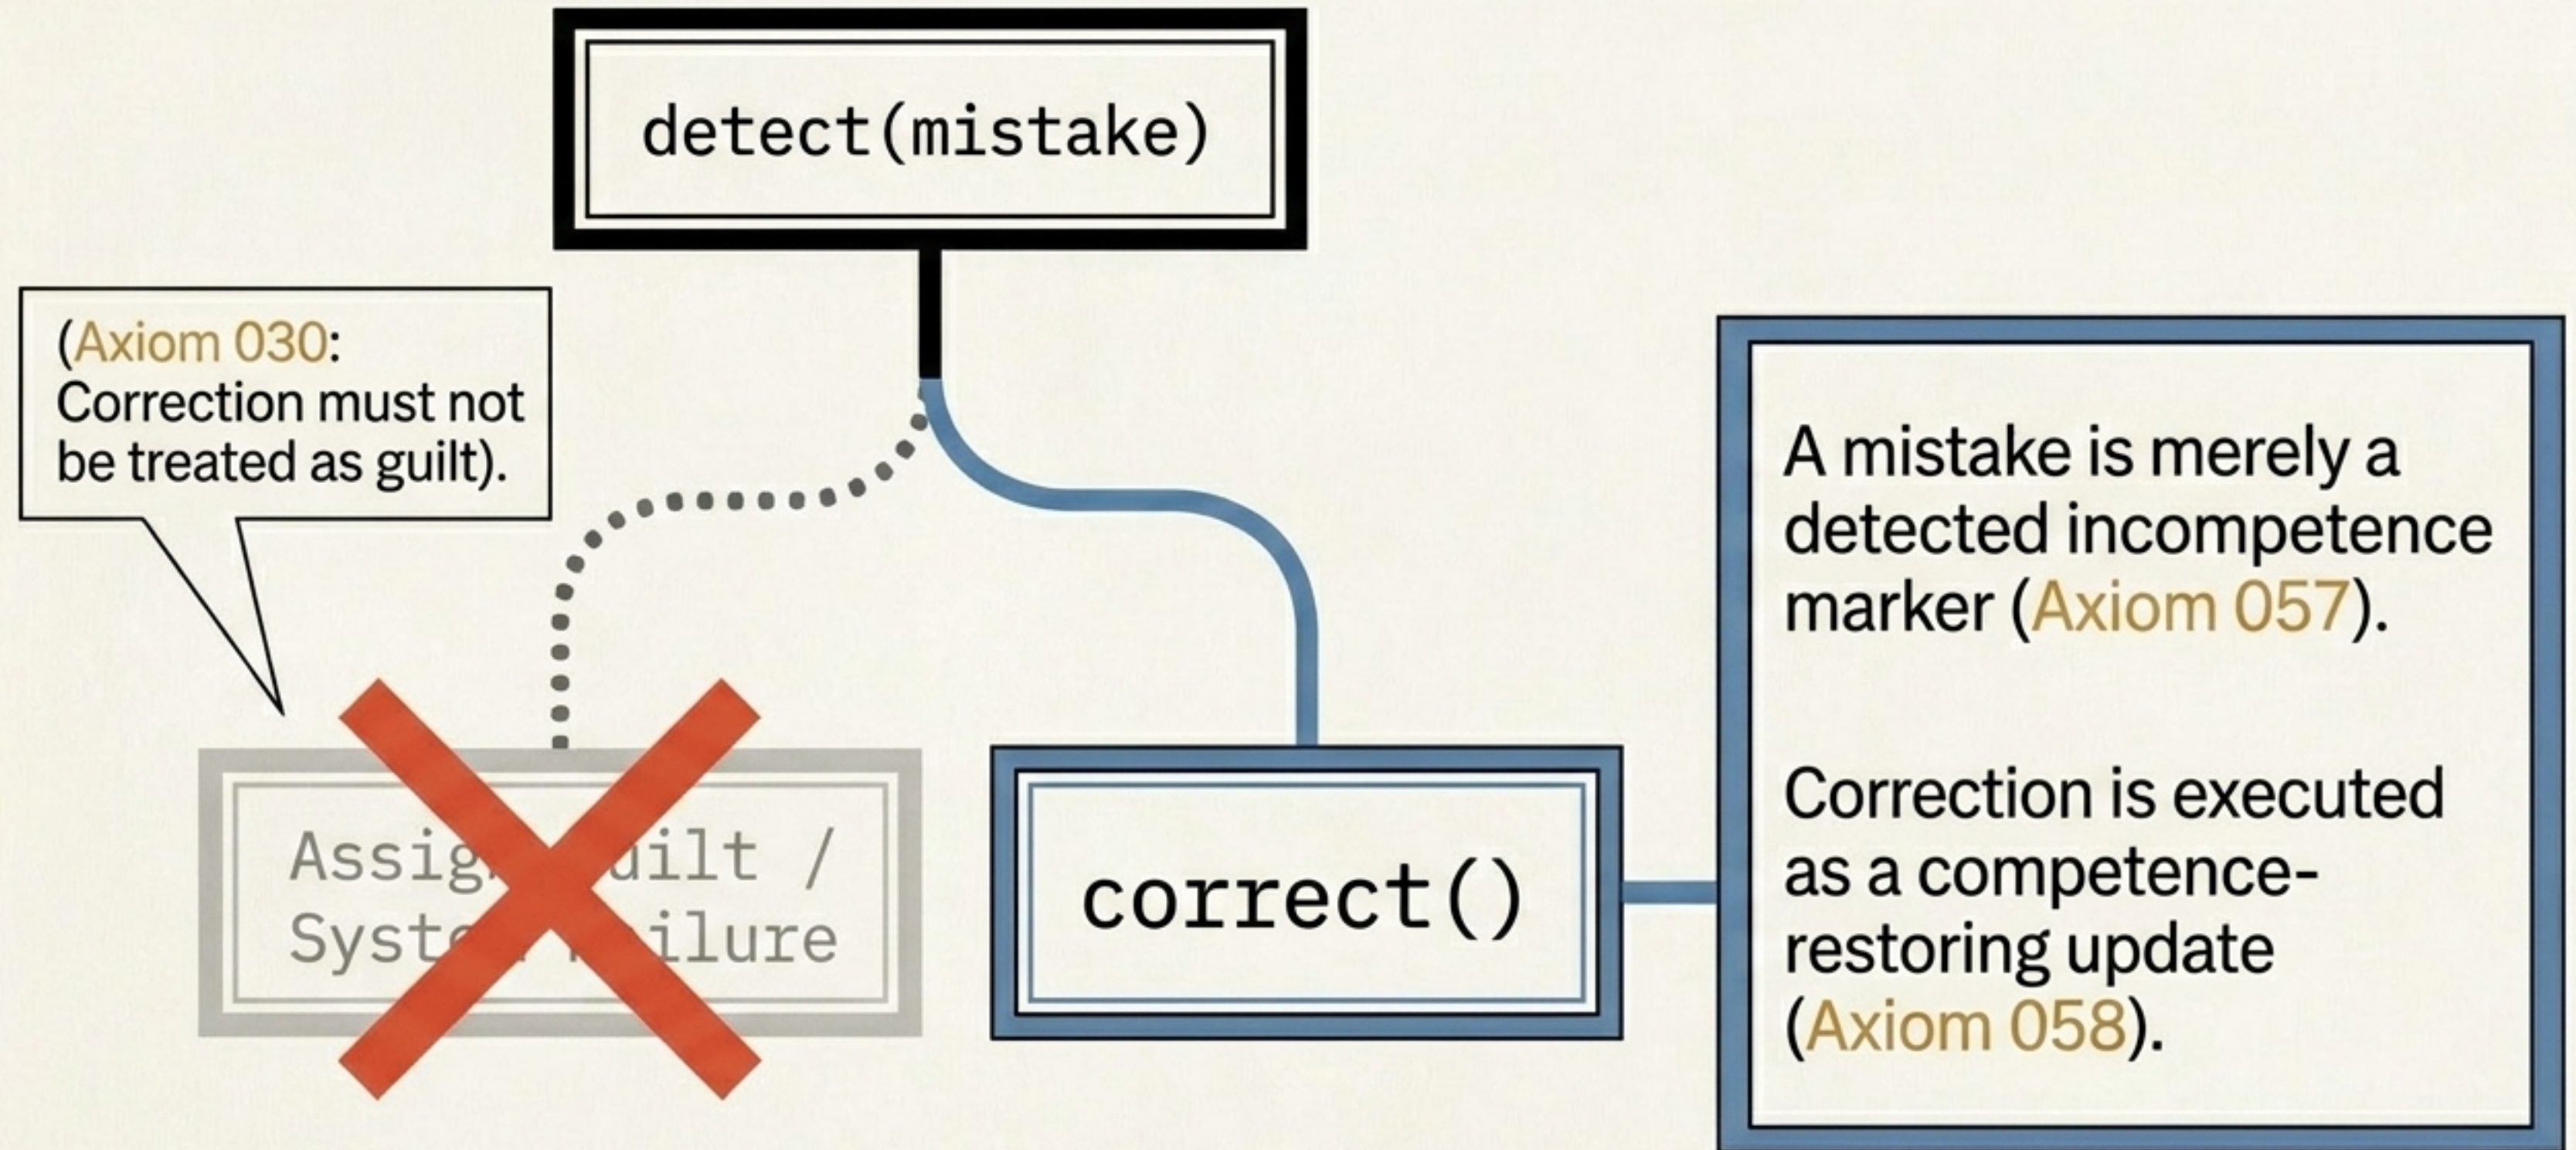

Operation Pipeline Phase III: Action & Environ & Environment

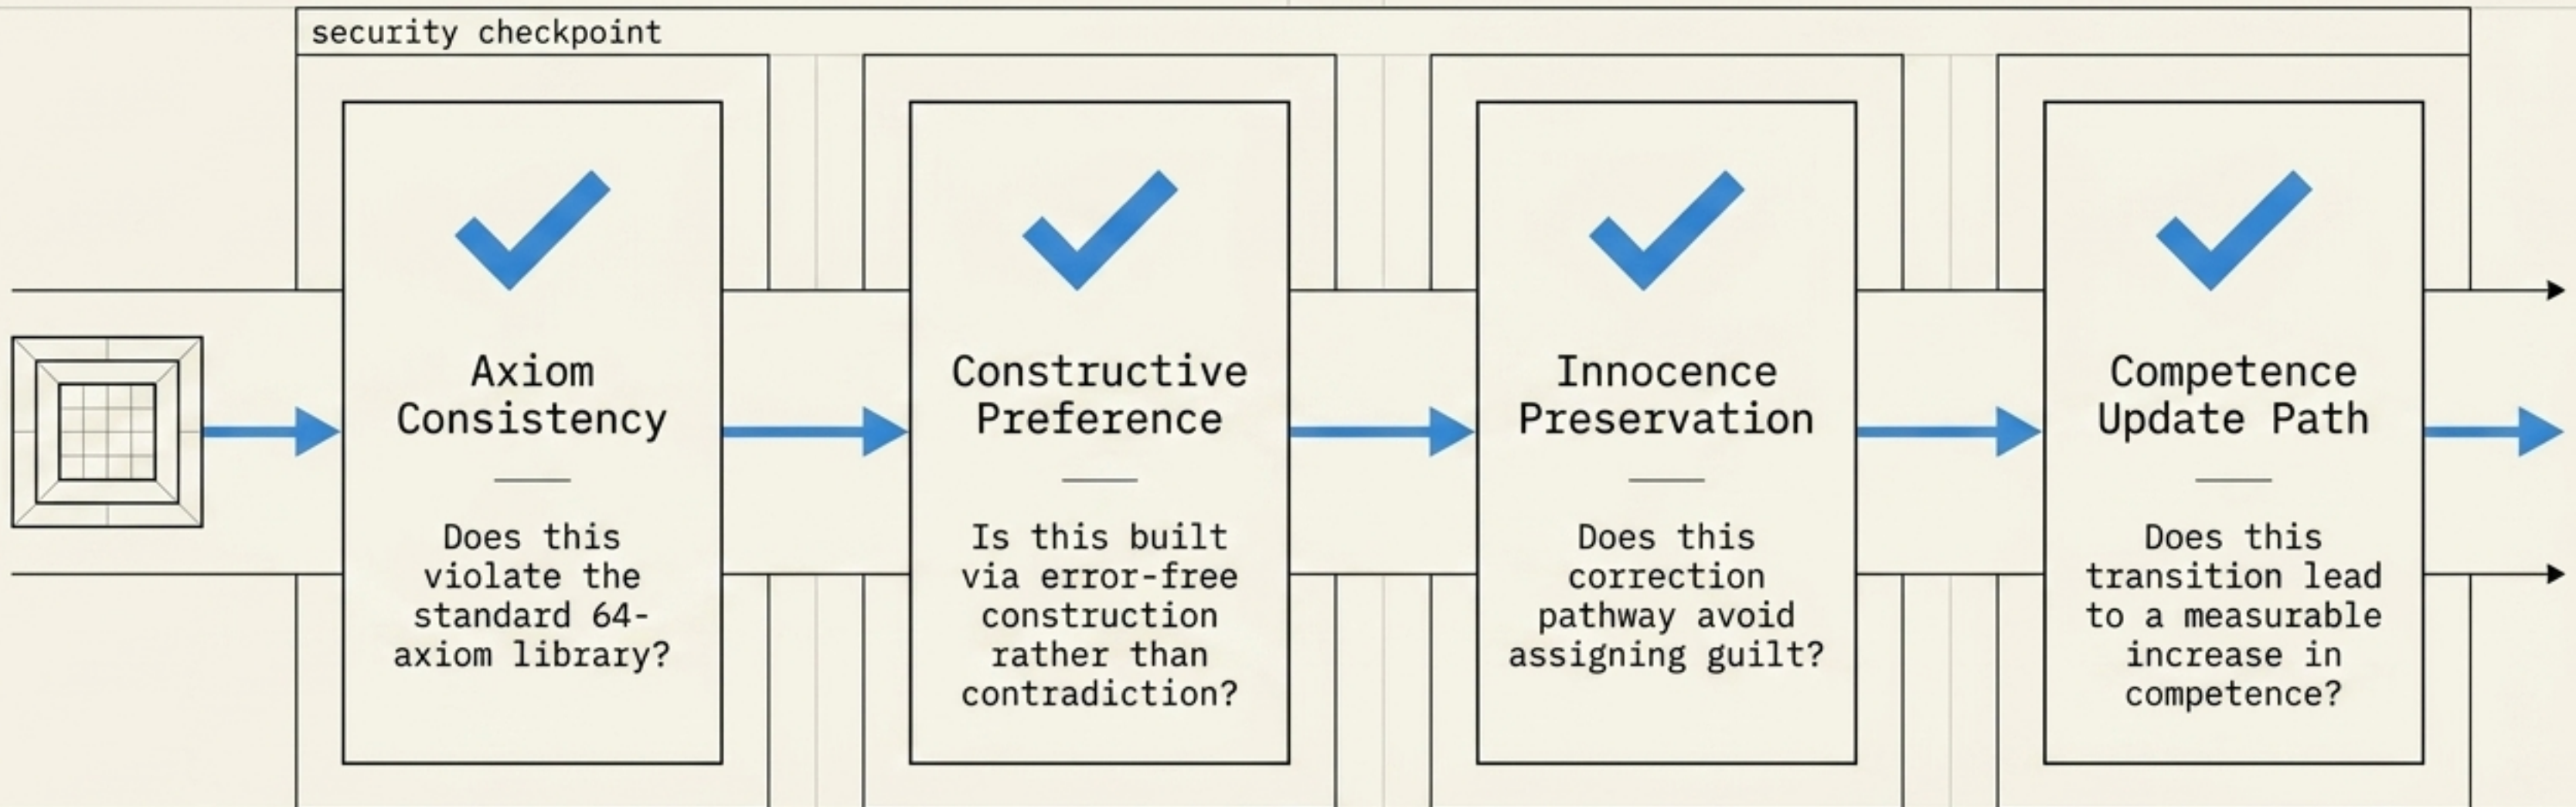

System States: Diagnostic Matrix

	System Signal	Spatial Geometry	Proof Engine
Competence	Decreases System Pain (Positive State).	Stable, N-Dimensional Functional Axial Space.	Driven by Error-Free Construction.
Incompetence	Increases System Pain (Negative State).	Unstable; lacks stable constructive basis.	Marked by Contradiction / Corruption Signals.

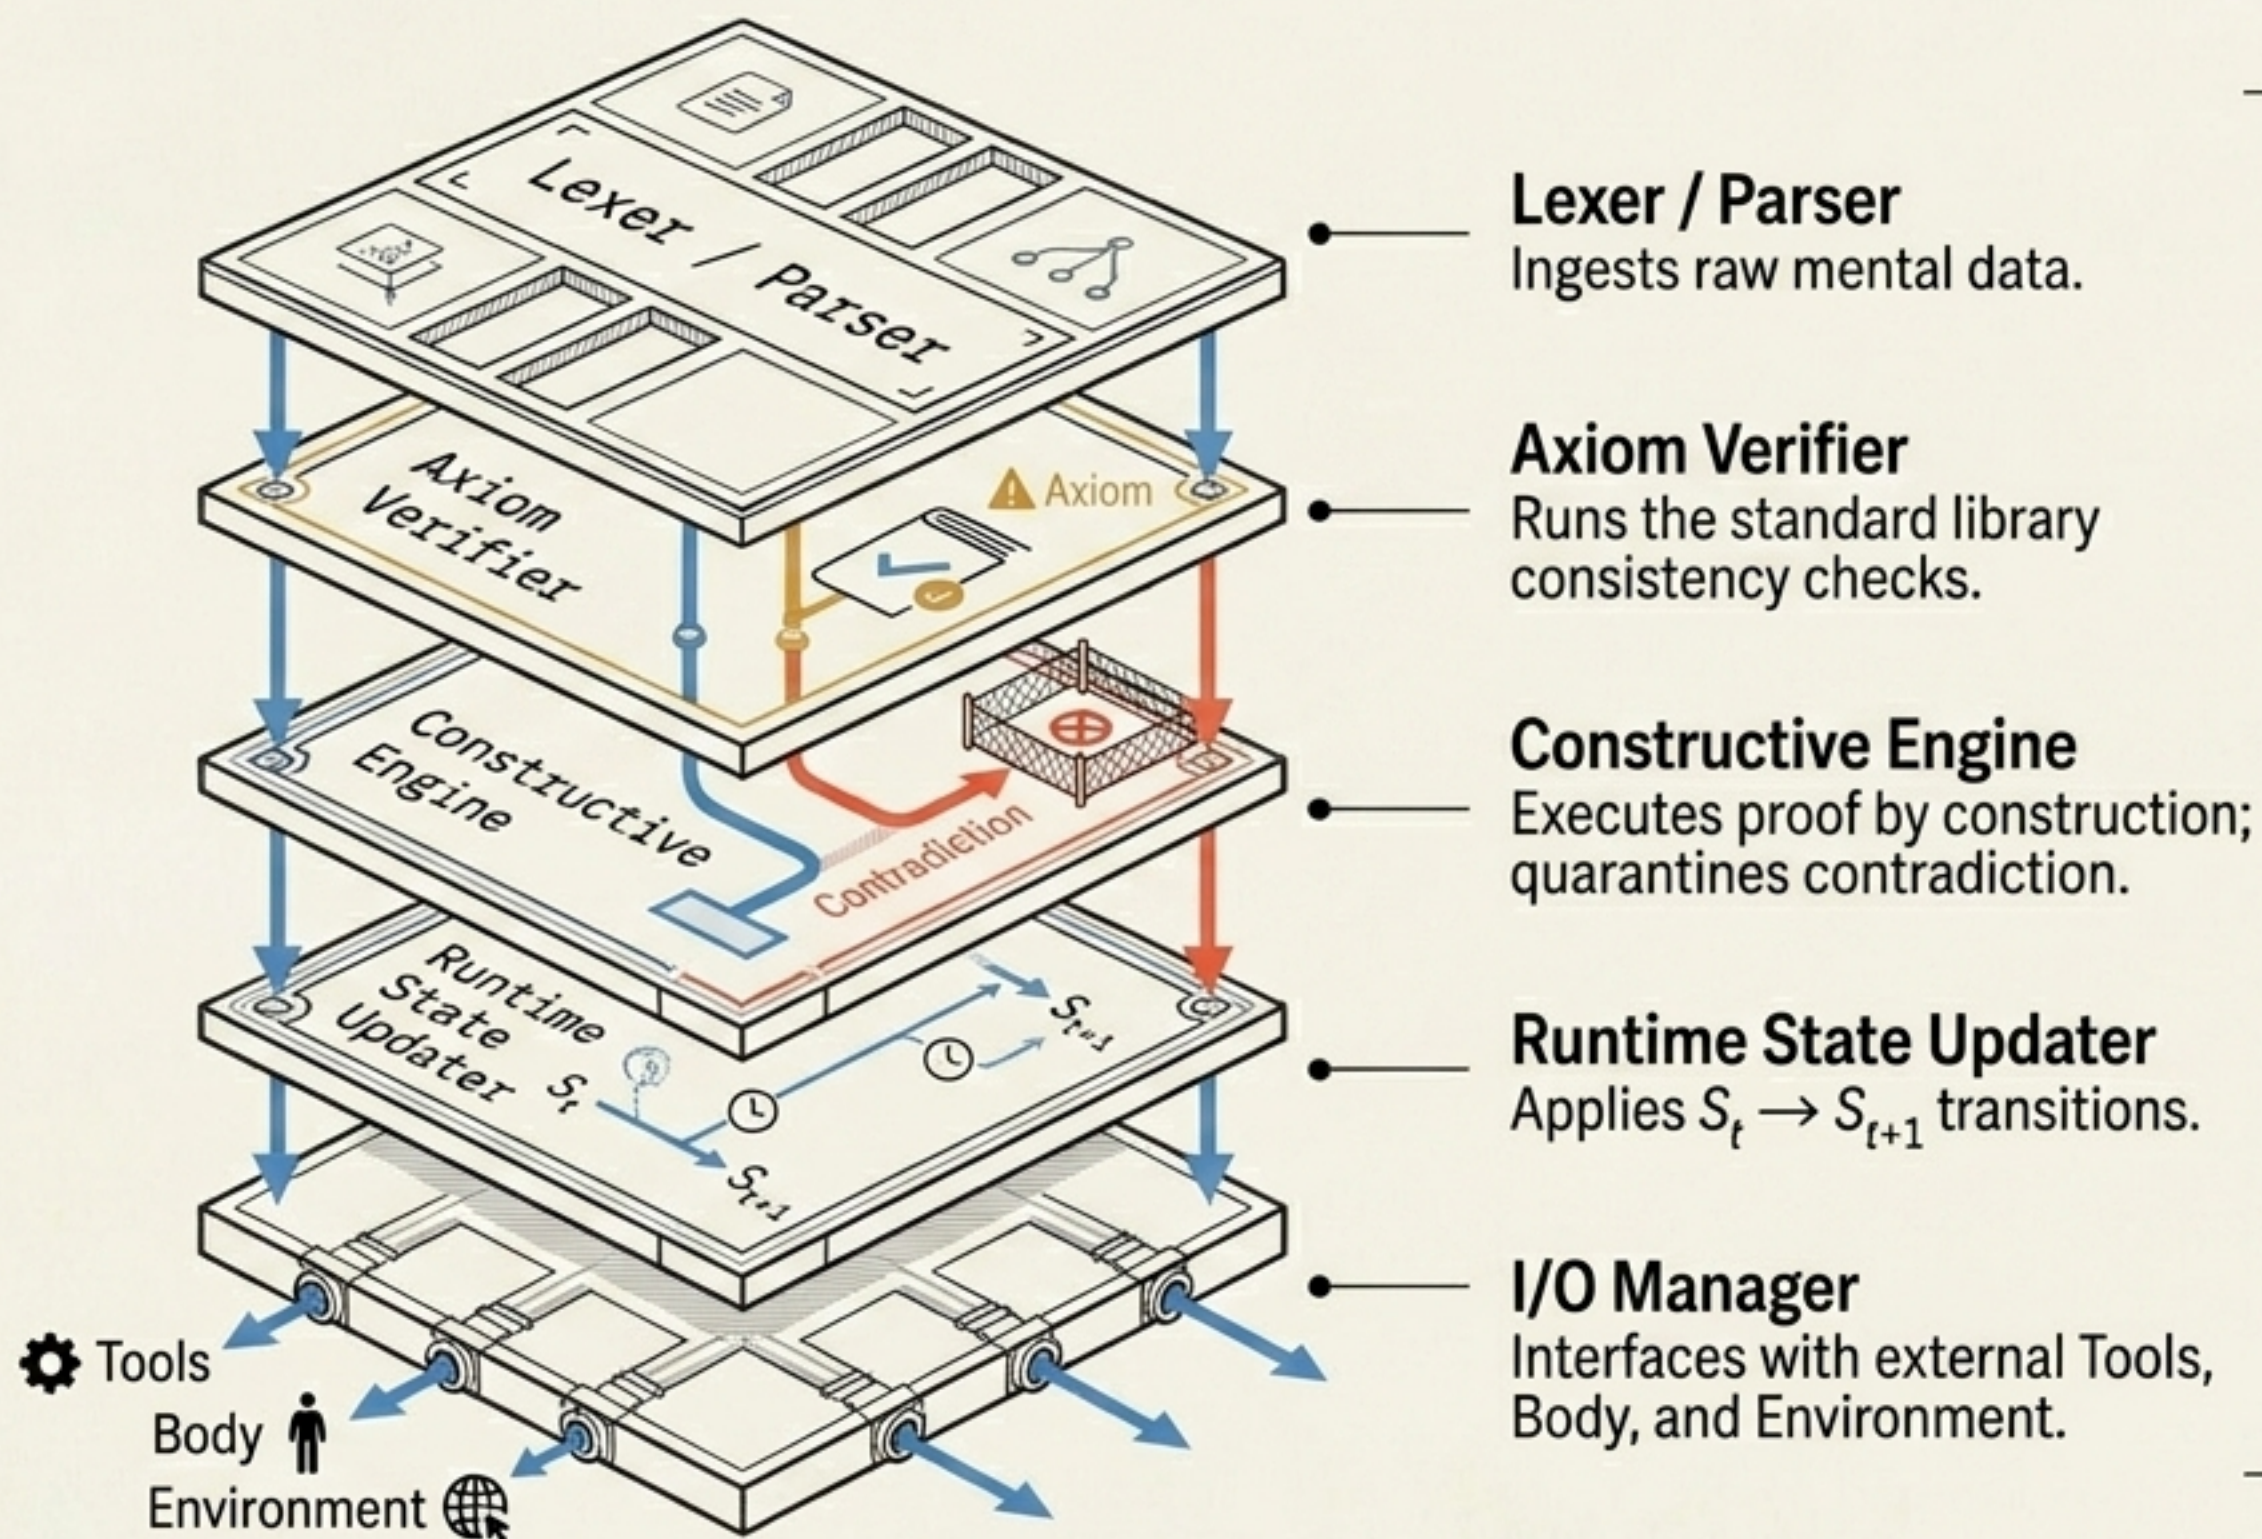

Innocence-Preserving Correction

The 4-Stage Verification System

Interpreter Architecture Stack

The Final Identity

$$S_{t+1} = \text{Update}(S_t, \text{learn}(\text{construct}(\text{competence})))$$

A framework treating the human condition as a verifiable, distributed database.

Moving perpetually from incompetence to optimized n-dimensional competence.

Governed always by error-free construction and universal innocence.
